

WOMEN'S HEALTH
IS OUR CONCERN

MANAGEMENT PERSPECTIVE

BREAST CANCER SCREENING

BCS is a modular screening solution supporting nationwide Breast Cancer Screening programs. The BCS solution facilitates the entire process: from collecting data from population administrations, planning and inviting women eligible for screening, through registration, examination and reading to the evaluation and possible follow-up.

**First and foremost:
IMPROVING HEALTH**

The effectiveness of a screening program is highly dependent on the attendance rate of eligible women. Years of experience have been translated into BCS to optimize the attendance through the implementation of policies and procedures in the invitation process. BCS will optimize the usage of your scanning equipment through its flexible planning ability. Using a sophisticated structure of time and location based screening, BCS enables you to plan capacity and visits for fixed and mobile screening units effectively. Client history and specific needs (in configurable target groups) will enable your planners to generate schedules that will prove to be reliable and become even more reliable as planners gain experience. This will diminish waiting time for clients as well as technicians during the screening process. Our client portal will enable women to interactively change their appointments and the scheduling will smoothly adjust to their personal preferences.

MANAGING ICT

It may be the case that you want to run BCS in your own environment, integrated in a broader ICT-infrastructure. We can provide you with the knowledge and experience to set it up. Most of our customers, however, choose to concentrate on their core business and leave it up to us to provide an adequate, reliable and professional ICT-environment, providing a turn key solution with software as a service... stress free.

MANAGING THE PROCESS

To be able to manage continuously the effectiveness and quality of your processes, BCS provides many predefined reports. These reports are based on requirements we've discussed with our customers over the years and they support your workflow as well as management processes or statistical overviews. These reports are highly flexible and can be adjusted to your specific needs. Additionally, any customized report can be integrated easily in the BCS-environment. The follow-up module facilitates feedback about additional exams and treatment, enabling you to evaluate the quality of the screening process.

MANAGING YOUR INFRASTRUCTURE

Through the usage of industry standards, BCS will make your organisation highly independent of specific hardware vendors and their equipment. Furthermore client-related communication with other environments (for example with imaging databases) is performed through secure transactions adhering to the standards in the health industry.

MANAGING YOUR DOCUMENTS

BCS will generate invitations at the right moment, personalized for both target groups and individual clients, to further improve the attendance rate. Result letters are generated automatically and distributed in a sensitive process that involves both clients and their GP's. Many other types of documents are available and configurable to match with your own templates.

Effective implementation and support

An effective operation depends on a professional implementation and a professional support organization. RADventure will add years of experience with screening software to make your implementation successful. Our employees know about screening processes and their details. They have experience in connecting with national or regional population databases and in how to synchronize with them. These are the same employees that can guide you through training programs, specifically tailored for the different types of stakeholders. Our helpdesk is evenly skilled and therefore guarantees quick and relevant response.
